Program Details (With Test Cases)

Program 1: StudentTracker

Field	Value
Program No.	1
Program Name	StudentTracker
Description	Person (Base Class) Represents a generic person with basic information. Instance Variables:

Field	Value
	<p>name (String)</p> <p>id (int)</p> <p>Constructor:</p> <p>Initializes name and id.</p> <pre>Ø=Ý9 Student (Inherits from Person) Represents a student with academic effort tracking.</pre> <p>Instance Variables:</p> <pre>hardWorkScore (int) ! (0-100) taskCompleted (int) ! (number of assignments out of 10)</pre> <p>Constructor:</p> <p>Calls super() and initializes additional fields.</p> <pre>Ø=Ý9 PlacementCandidate (Inherits from Student) Represents a final-year student evaluated for placement.</pre> <p>Instance Variables:</p> <pre>classAttendance (double) ! percentage (0-100) labAttendance (double) ! percentage (0-100)</pre> <p>Constructor:</p> <p>Uses constructor chaining to initialize all fields.</p> <p>Method:</p> <pre>void evaluateCandidate(int choice): menu using switch-case or if else : 1.Show all scores 2.Calculate placement probability 3.Show eligibility status (based on thresholds) 4.Exit</pre> <p>Placement Probability Logic:</p> <pre>probability = (hardWorkScore * 0.3 + taskCompleted * 5 + classAttendance * 0.2 + labAttendance * 0.2)</pre> <p>[Note :----</p> <p>Eligibility Rules:</p> <pre>Hard work score "e 70 Task completed "e 7 Class & Lab attendance "e 75%]</pre> <p>Take an ELC class StudentTracker and instantiate the PlacementCandidate and invoke the evaluateCandidate method .</p>

Field	Value
	<p>Sample Input :</p> <p>-----</p> <p>Name: virat ID: 101 HardWorkScore: 85 TaskCompleted: 9 ClassAttendance: 80.0 LabAttendance: 85.0</p> <p>Sample Output :</p> <p>-----</p> <p>Candidate: VIRAT (ID: 101)</p> <p>==== Placement Evaluation Menu ====</p> <p>1. View All Scores 2. Check Placement Probability 3. Check Placement Eligibility 4. Exit</p> <p>-----</p> <p>Enter your choice: 1</p> <p>Hard Work Score: 85 Tasks Completed: 9/10 Class Attendance: 80.0% Lab Attendance: 85.0%</p> <p>-----</p> <p>Enter your choice: 2</p> <p>Estimated Placement Probability: 92.5%</p> <p>-----</p> <p>Enter your choice: 3</p> <p>You are ELIGIBLE for placement!</p> <p>-----</p> <p>Enter your choice: 4</p> <p>Exiting...</p>
Constraints	
Sample Input	virat 101 85 9 80.0 85.0 1
Sample Output	Hard Work Score: 85 Tasks Completed: 9/10 Class Attendance: 80.0% Lab Attendance: 85.0%

Program 2: EmployeeSalaryDemo

Field	Value
Program No.	2
Program Name	EmployeeSalaryDemo
Description	<p>Create a class Employee (Business Logic Class)</p> <p>Non static Fields :</p> <pre>employeeNumber : private-int employeeName : private-String employeeSalary:private -double</pre> <p>Create a parameterized constructor to initialize all the fields.</p> <p>Create a pair of setter and getter methods for all the Non static fields.</p> <p>Methods :</p> <p>-----</p> <p>1)</p> <p>Method Name : getEmployeeDesignation()</p> <p>Parameter : double salary [Here method should receive updated salary]</p> <p>Return Type : String</p> <p>Access modifier : public</p> <p>In this method, Take the updated salary in the parameter variable and return the employee designation based on the following criteria :</p> <ul style="list-style-type: none"> a) If updatedSalary is greater than 120000, return Employee is a HR Manager. b) If updatedSalary is greater than 90000, return Employee is a Developer. c) If updatedSalary is greater than 60000, return Employee is a Designer. d) In the else part, return Employee is a Tester. <p>Take toString() method to print Employee Object properties.</p> <p>Create an ELC class EmployeeDemo which contains main method, with the help of Scanner class take the input from the user to initialize the non static field through parameterized constructor.</p> <p>Print the employee details using toString() method.</p> <p>Take the salary increment amount from the user using Scanner class, update the employee salary using setter and getter.</p> <p>Print the employee data with updated salary.</p> <p>Pass this updated salary to getEmployeeDesignation() method to get and print the Employee Designation as per below output.</p>
Constraints	
Sample Input	101 Ravi 80000 10000
Sample Output	Updated Salary = 90000.0 ! Employee is a Developer
